

Self-Watering Rolling Planter

Important: Before planting, lift the Soil Grid from inside the planter. Take out any planter parts that may be stored underneath, then snap the grid back into place.

This self-watering planter provides easy portability while ensuring your plants won't dry out.

Parts List:	Qty
Fill Tube (located under grid)	1
Water Level Indicator	1
Wheel Casters	4

Assembly

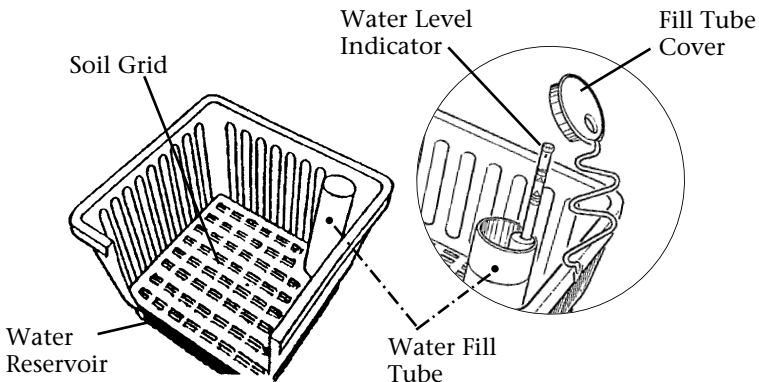

Step 1. Before planting, lift the Soil Grid from inside the planter. Take out any planter parts that may be stored underneath, then snap the grid back into place.

Step 2. For outdoor use, you'll need to remove the drainage plugs. Working from inside the planter, use a hammer to firmly tap the 4 elevated plugs that are located on the edges of the water reservoir floor. They will pop out of the bottom.

Step 3. Push the 4 Casters into each corner hole on the bottom of the planter. They will "snap" into place.

Step 4. Insert the Water Level Indicator into the small pre-molded circle on the planter floor. The float inside the tube indicates when it's time to refill the water reservoir.

Over, please

Step 5. Position the Water Fill Tube over the Water Level Indicator and into the larger premolded circle. Use this tube to fill the reservoir with water. To reduce evaporation, the Fill Tube has a Cover that snaps on top. (You'll find the Cover attached to the side of the planter.)

Step 6. Place premoistened soil on top of the grid, plant your flowers or vegetables and water the soil.

Step 7. Pour water into the Water Fill Tube until the Water Level Indicator shows the Water Reservoir is full. The reservoir guarantees your plants will receive an optimal amount of water for healthy growth. For

most plants, you should check the water level in the reservoir weekly. You may need to check the water level more frequently in very hot weather or if the planter contains a very large plant.
